Momentum is the right way to engage the right person at the right time.

Emergency management for hospitals

The best way to alert and manage your staff

Every single day, hospitals deal with a large quantity of emergencies.
With Momentum, the emergency management system fully developed in Switzerland, alerting your doctors, nurses, responders, and technicians is an automated and smooth process.

The software automatically selects the personnel to alert, communicates with them via several communication channels, and it helps you monitor the situation.

Momentum can be easily integrated to your dispatch center software, to pre-existing alarm systems or to scheduling & shift planning software.

There are 2 main areas of application:

Optimize Rescue Operations
01

You can use Momentum to dispatch alerts to responders with specific skills based on their location and availability and ask them to intervene or give them instructions.

Being already integrated with the CAD software, Momentum is in use in several Swiss Cantons to manage lay responders in case of out-of-hospital cardiac arrest.

Momentum is adopted by:
144 Ticino, Kanton Bern, Fribourg..

.

To deal with out-of-the-ordinary events
02

Momentum can be used to alert groups of responders also in case of extraordinary events.
What would you do in case of flood, wildfires or major accidents?
Using Momentum, you can alert broad groups of responders and know real-time who is available to intervene, who is closer to the emergency site, or – on the other hand - know who needs to be evacuated.

With this purpose, Momentum has already been adopted in Ticino by Ente Ospedaliero Cantonale EOC.
